DEFINED BENEFIT PENSIONS

The best path for states to provide retirement security to public employees and their families.

WHAT IS A DEFINED BENEFIT PENSION?

After a lifetime of hard work, employees deserve financial security in retirement. Defined benefit pensions are the most cost effective way to allow teachers, firefighters, nurses, librarians, and other public servants to retire with dignity. Cities and states have provided pensions to public employees for more than 100 years because they ensure a dignified and secure retirement.

DID YOU KNOW?

The first public pension plans were established in New York in the late 19th century.

Defined benefit pensions provide regular, monthly payments for life to retired public employees. Pension plans offer low fees, asset diversification, longevity risk pooling, and professional management. Because of these advantages, pensions are able to provide equivalent benefits for about half the cost of 401(k)-style defined contribution plans.

Most pension plans calculate pension benefits using a formula that involves three factors: the number of years of service of the employee; the final average salary of the employee; and a benefit multiplier. The multiplier is a percentage, often ranging from 1% – 2.5%, that determines the size of the benefit amount. The formula can be adjusted to make pensions more or less generous.

Years of Service x Final Average Salary x Benefit Multiplier = Pension Benefit

WHO PAYS FOR PUBLIC PENSIONS?

Most plans receive money from three sources: employers, employees, and investment earnings. On average, $0.75 of each dollar in a pension fund comes from employee contributions and investment earnings - not from taxpayers. Most public employees contribute a portion of their salary to their pension - and they never miss a payment.

PENSION FACT

According to the U.S. Census Bureau, the average public employee earns a monthly benefit of $2,289 - enough for a very modest retirement.

AMERICANS WANT RETIREMENT SECURITY AND PUBLIC EMPLOYEES WANT PENSIONS

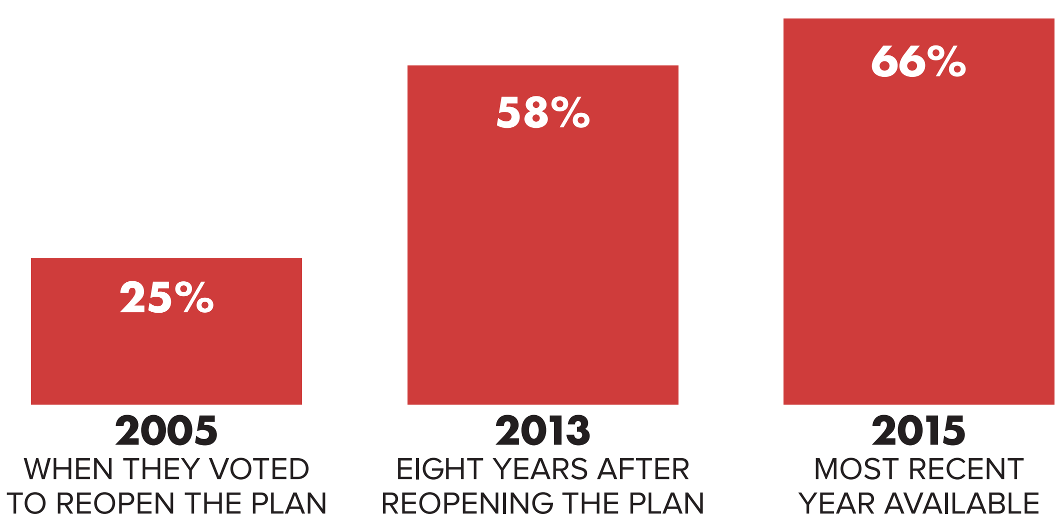
Our communities are stronger when working people have good-paying jobs and a secure retirement. 86% of Americans say our nation's political leaders should prioritize retirement security for working families and 85% of Americans believe that all workers should have access to a defined benefit pension.

In most cities and states across the nation, public employees still have access to a defined benefit pension. In certain states, public employees have a choice between a defined benefit pension and a 401(k)-style defined contribution plan. When faced with this choice, public employees overwhelmingly choose pensions.

In seven states that offer this choice, more than 75% of public employees chose the pension plan.

CASE STUDY: WEST VIRGINIA

Defined benefit pensions are the most cost-effective retirement plan for a state to provide. Unfortunately, there is a misperception that switching to a 401(k)-style defined contribution plan is cheaper and can reduce an unfunded liability in a public pension plan. Neither are true, as West Virginia learned the hard way. In 1991, West Virginia, struggling with an unfunded liability, switched its teachers from a defined benefit pension to a 401(k)-style plan. By 2005, funding for the Teachers Retirement System hit rock bottom with a 25% funding ratio. Additionally, the state found it was spending twice as much to provide a retirement benefit under the 401(k)-style plan. The state reopened the defined benefit plan in 2005 and committed to a more stringent funding policy and, over the following years, funding levels rebounded. The state is projected to save $1.2 billion in the first thirty years by reopening the pension plan. Sticking to a good funding policy is the best way to avoid underfunding a plan.



FUNDING DISCIPLINE MATTERS MOST

The states that have experienced the most success with their public pension plans are the ones that consistently fully fund their pension plans each year. No changes to plan design can make up for the losses if the funding is not adequate.

After experiencing severe losses during the Great Recession, public pension funds are recouping their losses and returning to healthy funding levels. According to the National Conference of Public Employee Retirement Systems, the **average funded level in 2017 was 71.3 percent.**

State and local pension funds collectively manage more than $3.6 trillion in assets and they play an important role in the economies of states and local communities. In 2014, retiree spending of pension benefits generated $1.2 trillion in total economic output, supporting some 7.1 million jobs across the U.S. This is a significant return on investment for taxpayers.
